Outline

- 1 Introduction
- 2 Background Study
 - Control Techniques
 - Modeling a 2-DOF Helicopter
 - Control Algorithm and Architecture
 - Prior Work
- 3 Subsystem Level Functional Requirements
 - Block Diagram
- 4 Simulation
 - Optimal Control Simulation
 - Optimal and Noise Resistant Control Simulation
- 5 Implementation
 - USB
 - Android
 - Demonstration
- 6 Future Directions

- Helicopter are important for short-distance travel
 - air-sea rescue
 - fire fighting
 - traffic control
 - tourism
- Purpose of control system
 - resistance to turbulence
 - enable use of mobile device
- Which is better?
 - Optimal Control (Linear Quadratic Regulator)
 - Optimal Noise Resistant Control (Linear Quadratic Gaussian)
 - Machine Learning (Approximate Dynamic Programming)

Introduction

Figure 1: General High-Level System Architecture

Introduction

- This project will:
 - use a pair of 2-DOF (2-degrees-of-freedom) testing platforms
 - implement control algorithms on embedded system
 - use mobile device for user control
 - encourage research
 - serve as an educational tool

Background Study

Control Techniques

Various control techniques have been proposed for 2-DOF helicopters such as:

- Sliding mode control [1]
- Fuzzy Logic control [2] [3] [4]
- Data-driven Adaptive Optimal Output-feedback control [5]
- Decentralized discrete-time neural control [6]

These control techniques employ advanced mathematics that are difficult to implement on embedded systems.

Background Study

Modeling a 2-DOF Helicopter

Figure 2: Model of a 2-DOF Helicopter

Figure 3: Quanser Aero

Background Study

Modeling a 2-DOF Helicopter

- Characterized by fixed base
 - Can change 2 of 3 possible orientations...
 - Pitch (θ)
 - Yaw (ψ)
 - *Not Roll*
 - and cannot change position
 - x direction
 - y direction
 - z direction

Background Study

Modeling a 2-DOF Helicopter

- Motors are attached to the propellers to create thrust due to air resistance
 - Main - changes pitch angle
 - Tail - changes yaw angle
- Torque due to rotation also creates a force on opposite axes

Background Study

Modeling a 2-DOF Helicopter

Due to the efficiency of the Quanser Aero, we can create a linearized system model:

$$\dot{\mathbf{x}}(t) = \mathbf{Ax}(t) + \mathbf{Bu}(t), \text{ such that} \quad (1)$$

$$\begin{bmatrix} \dot{\theta} \\ \dot{\psi} \\ \ddot{\theta} \\ \ddot{\psi} \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & -K_{sp}/J_p & -D_p/J_p & 0 \\ 0 & 0 & 1 & -D_y/J_y \end{bmatrix} \begin{bmatrix} \theta \\ \psi \\ \dot{\theta} \\ \dot{\psi} \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ K_{pp}/J_p & K_{py}/J_p \\ K_{yp}/J_y & K_{yy}/J_y \end{bmatrix} \begin{bmatrix} V_p \\ V_y \end{bmatrix}$$

Background Study

Modeling a 2-DOF Helicopter

- K_{sp} - being the stiffness of the axes
- K_{pp} - pitch motor thrust constant
- K_{py} - thrust constant acting on the pitch angle from the yaw motor
- K_{yp} - thrust constant acting on the yaw angle from the pitch motor
- K_{yy} - yaw motor thrust constant
- J_p - moment of inertia about pitch axis
- J_y - moment of inertia about yaw axis
- D_p - viscous damping of the pitch axis
- D_y - viscous damping of the yaw axis

Background Study

Control Algorithm Overview - Optimal Control

- 1 Employ state-space representation of 2-DOF helicopter:

$$\dot{\mathbf{x}} = \mathbf{A}\mathbf{x} + \mathbf{B}\mathbf{u}$$

- 2 Use state feedback law

$$\mathbf{u} = -\mathbf{K}\mathbf{x}$$

to minimize the quadratic cost function:

$$J(\mathbf{u}) = \int_0^{\infty} (\mathbf{x}^T \mathbf{Q} \mathbf{x} + \mathbf{u}^T \mathbf{R} \mathbf{u} + 2\mathbf{x}^T \mathbf{N} \mathbf{u}) dt$$

- 3 Find the solution \mathbf{S} to the Riccati equation

$$\mathbf{A}^T \mathbf{S} + \mathbf{S} \mathbf{A} - (\mathbf{S} \mathbf{B} + \mathbf{N}) \mathbf{R}^{-1} (\mathbf{B}^T \mathbf{S} + \mathbf{N}^T) + \mathbf{Q} = 0$$

- 4 Calculate gain, \mathbf{K}

$$\mathbf{K} = \mathbf{R}^{-1} (\mathbf{B}^T \mathbf{S} + \mathbf{N}^T)$$

Background Study

Control Algorithm Overview - Optimal Noise Resistant Control

- Utilizes gain calculated in LQR
- Added Kalman filter to reduce external disturbances to the system

Future Directions

- Discretization of System
- Digital Compass
- Enhanced Smart Control

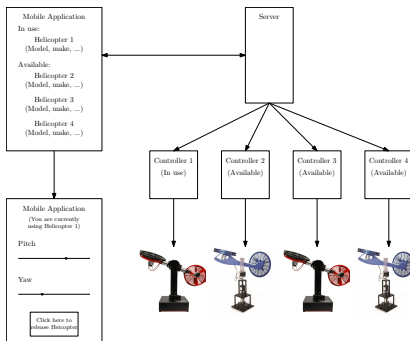

Figure 22: Enhanced Smart Control

- Implementation on 6-DOF Helicopter

Summary

- Embedded implementation of control algorithms
- Mobile interface
- PI control improves steady-state error
- Machine Learning is best when system parameters are unknown or time-variant

Acknowledgement

Special Thanks to Andrew Fandel, Anthony Birge, and Dr. Suruz Miah for their work with Machine Learning on a 2-DOF Helicopter
